

CLAIMS

2 *Sub any* 1. A kit for a securable enclosure, the securable enclosure having a front opening and being placeable selectively in an assembled state and a disassembled state, said kit comprising:

4 a top panel;
first and second side panels;
6 a rear panel,
the top panel, first and second side panels, and rear panel being connected to each other to bound a storage space accessible through the front opening;
8 a first connector part fixedly attached to one of the top panel, first side panel, second side panel, and rear panel; and
10 a second connector part fixedly attached to another one of the top panel first side panel, second side panel, and rear panel,
12 the first and second connector parts being connectable, each to the other, without any additional separate parts to maintain the one and the another of the top panel, first side panel, second side panel, and rear panel together with the kit in the assembled state.

2 2. The kit for a securable enclosure according to claim 1 wherein the first connector part comprises a clip body and the second connector part comprises a repositionable lock hook that is releasably connectable to the clip body.
4

3. The kit for a securable enclosure according to claim 2 wherein the lock hook is accessible only through the front opening with the kit in the assembled state.

4. The kit for a securable enclosure according to claim 2 wherein the top panel is releasably connectable to each of the first and second side panels and rear panel through releasable cooperating connector parts with one of the releasable cooperating connector parts being fixedly attached to one of the top panel, first side panel, second side panel, and rear panel and another of the cooperating connector parts being fixed to another of the top panel, first side panel, second side panel, and rear panel, the releasable cooperating connector parts being connectable, each to the other, without any additional separate parts.

5. The kit for a securable enclosure according to claim 1 wherein the kit further comprises a front frame panel for a closure element and the front frame panel is releasably connectable to at least one of the top panel, first side panel, and second side panel through releasable cooperating connector parts with one of the releasable cooperating connector parts being fixedly attached to one of the front frame panel, top panel, first side panel, and second side panel and another of the releasable cooperating connector parts being fixedly attached to another of the front frame panel, top panel, first side panel, and second side panel, the releasable cooperating connector parts being connectable, each to the other, without any additional separate parts.

2 6. The kit for a securable enclosure according to claim 5 further
4 comprising a closure element that is mounted to the front frame panel for moment
between a) an open position wherein the storage space can be accessed through
the front opening and b) a closed position.

2 7. The kit for a securable enclosure according to claim 6 wherein with
the closure element in the closed position, the cooperating connector parts cannot
be accessed from outside of the storage space.

2 8. The kit for a securable enclosure according to claim 1 further
comprising a bottom panel which is releasably connected to at least one of the first
side panel, second side panel, and rear panel.

2 9. The kit for a securable enclosure according to claim 8 wherein the
bottom panel is releasably connected to the at least one of the first side panel,
second side panel, and rear panel through releasable cooperating connector parts
4 with one of the cooperating connector parts being attached to the bottom panel
and another of the connector parts being attached to the at least one of the first
6 side panel, second side panel, and rear panel.

2 10. The kit for a securable enclosure according to claim 1 wherein the
kit further comprises a bottom panel and a reinforcing rod that extends between
the top panel and the bottom panel, the reinforcing rod being spaced from each
4 of the first and second side panels and the rear panel.

11. The kit for a securable enclosure according to claim 1 wherein the one of the top panel, first side panel, second side panel, and rear panel has a substantially flat first surface and a first flange with a flat surface that is angularly disposed to the first surface, the another of the top panel, first side panel, second side panel and rear panel has a substantially flat second surface and a second flange with a flat surface that is angularly disposed to the second surface, and with the kit in the assembled state, the flat surface on the first flange is facially abutted to the flat surface on the second flange.

12. The kit for a securable enclosure according to claim 11 wherein the first surface is substantially orthogonal to the second surface.

13. The kit for a securable enclosure according to claim 11 wherein the first and second connector parts biasably draw the flat surfaces on the first and second flanges against each other.

14. The kit for a securable enclosure according to claim 11 wherein the first and second flanges each have an opening therethrough to accommodate the first and second connector parts.

15. The kit for a securable enclosure according to claim 1 wherein the first and second connector parts are releasably, biasably held connected to each other.

2 16. The kit for a securable enclosure according to claim 1 wherein the
4 first and second connector parts define a connector assembly, wherein the kit
6 comprises a plurality of connector assemblies including at least one connector
8 assembly that acts between each of a) the top panel and at least one of the first
side panel, second side panel, and rear panel, b) the first side panel and at least
one of the top panel and the rear panel, c) the second side panel and at least one
of the top panel and the rear panel, and d) the rear panel and at least one of the
top panel, the first side panel, and the second side panel.

2 17. The kit for a securable enclosure according to claim 16 wherein the
4 plurality of connector assemblies maintain the top panel, first and second side
panels, and rear panel together with the kit in the assembled state without any
separate fasteners.

2 18. The kit for a securable enclosure according to claim 1 wherein a first
4 of the top panel, first side panel, second side panel, and rear panel has a locating
post thereon, and another of the top panel, first side panel, second side panel, and
rear panel has a locating slot thereon to receive the locating post with the kit in the
assembled state.

2 19. The kit for a securable enclosure according to claim 18 wherein the
locating post is fixed on the first panel.

20. The kit for a securable enclosure according to claim 19 wherein the locating post comprises a neck with an enlarged head on the neck, the enlarged head is movable into the locating slot by moving the first panel in a first direction in a first line with the first and another panels in a first relative position, and the slot is configured so that with the enlarged head moved through the slot, shifting of the first panel relative to the another panel transverse to the first line to a second relative position causes the enlarged head to act against the another panel to thereby block movement of the enlarged head out of the slot by movement of the first panel parallel to the first line oppositely to the first direction.

21. The kit for a securable enclosure according to claim 20 further comprising a third connector part on the first panel and a fourth connector part on the another panel, the third and fourth connector parts being releasably connectable, each to the other to maintain the first and another panels in the second relative position.

22. A kit for a securable enclosure, said securable enclosure having a front opening and being placeable selectively in an assembled state and a disassembled state, said kit comprising:

a plurality of panels that are connected together to bound a storage space accessible through the front opening,

a first connector part fixedly attached to one of the panels; and

a second connector part fixedly attached to another one of the panels,

8 the first and second connector parts being connectable, each to the other,
without any additional separate parts to releasably maintain the one and the
10 another panels together with the kit in the assembled state.

23. The kit for a securable enclosure according to claim 22 wherein the
2 first and second connector parts are releasably connected to each other.

24. The kit for a securable enclosure according to claim 22 wherein the
2 one and the another of the panels have surfaces that are flat and substantially
orthogonal to each other.

25. The kit for a securable enclosure according to claim 24 wherein the
2 one panel has a first flange with a flat surface that is angularly disposed to the
surface of the one panel, the another panel has a second flange with a flat surface
4 that is angularly disposed to the surface of the another panel, and with the kit in
the assembled state the flat surfaces on the first and second flanges are facially
6 abutted to each other.

26. The kit for a securable enclosure according to claim 25 wherein the
2 first connector part comprises a clip body and the second connector part
comprises a repositionable lock hook that is releasably connectable to the clip
4 body.

6 27. The kit for a securable enclosure according to claim 24 wherein the first and second connector parts are releasably biasably held connected to each other.

2 28. The kit for a securable enclosure according to claim 22 wherein a first of the panels has a locating post thereon and another of two panels has a locating slot thereon to receive the locating post with the kit in the assembled state.

4 29. The kit for a securable enclosure according to claim 28 wherein the locating post is fixed on the first panel.

2 30. The kit for a securable enclosure according to claim 29 wherein the locating post comprises a neck with an enlarged head on the neck, the enlarged head is movable into the locating slot by moving the first panel in a first direction in a first line with the first and another panels in a first relative position, and the slot is configured so that with the enlarged head moved through the slot, shifting of the first panel relative to the another panel transverse to the first line to a second relative position cause the enlarged head to act against the another panel to thereby block movement of the enlarged head out of the slot by movement of the first panel parallel to the first line oppositely to the first direction.
